

Big Fish is an ambitious and environmentally driven concept designed to revitalize the Brisbane River by introducing fresh ocean seawater through a dedicated pipeline system. This pipeline, stretching from the ocean into the heart of the river, features multiple outlets strategically placed to flush and cleanse the river of discoloration and pollutants. The process, due to the sheer volume of water involved, may span over a year, but the long-term benefits are profound. Big Fish also plans to integrate with the **Flood Solution Tunnel**, using its infrastructure to redirect and remove discolored river water efficiently, ensuring a continuous cycle of purification.

Once the river has undergone its flushing phase, Big Fish envisions the installation of sub-stations along the riverbanks. These stations will be equipped to pump various types of fish food into the water, supporting a thriving aquatic ecosystem. The goal is to reintroduce and sustain healthy fish populations, turning the Brisbane River into a vibrant, living waterway. In addition, numerous jetties will be constructed to encourage recreational fishing, social gatherings, and community engagement. Other recreational ideas—such as floating cafes, kayak trails, and riverside markets—are under consideration and will be explored for feasibility.

The benefits of Big Fish are extensive. Socially, it fosters interaction among residents and visitors, creating new public spaces for leisure and connection. Economically, it stimulates job creation in construction, maintenance, tourism, and hospitality. A cleaner, more attractive river will draw tourists, boosting local businesses and enhancing Brisbane's reputation as a forward-thinking, eco-conscious city. The revitalized river will also improve living standards, offering residents a healthier environment and more opportunities for outdoor activity.

Real estate markets will see a positive shift, as properties near the river become more desirable due to improved aesthetics, recreational access, and environmental quality. The entire operation will be powered by hydrogen energy, reinforcing Big Fish's commitment to sustainability and green innovation. In essence, Big Fish is more than a water management project—it's a vision for a cleaner, livelier, and more connected Brisbane, where nature and urban life coexist in harmony.
